Recent Research Topics: Fibrosis and chronic inflammation of organs are observed in systemic autoimmune disease and graft-versus-host disease after hematopoietic stem cell transplantation. Using a scleroderma mouse, we showed that transplantation of MHC compatible, minor antigen mismatched bone marrow stromal/stem cells (BMSCs) play a role in the pathogenesis of fibrosis. Similar findings were also studied in humans from lacrimal gland or conjunctival samples for diagnostic purpose. In addition, we are investigating whether senescent cells including macrophages and other immune competent cells are involved in chronic ocular graft-versus-host disease as well as other immune-mediated diseases.

Keywords: Dry eye disease, Ocular surface immunology, fibrosis, mesenchymal cells, graft-versus-host disease, Sjogren's syndrome, autoimmune disease.
